## Model Objective

Formulate a GNN-based architecture for a **multiclass graph-level classification** of enzyme tertiary structures dataset (ENZYMES from TUDataset)

## Success Criteria

1. Overall accuracy (test)  $\geq 0.75$
2. Class wise F1-score  $> 0.7$
3. Model max. memory allocation  $\leq 100$  MB

# Methods

## Dataset ENZYMES from TUDataset

### Description

Public graph dataset of **tertiary enzyme structures**. Labels encode the first number to one of the 6 EC top-level classes (EC 1.X.X.X - 6.X.X.X)

### Properties

- Static graph  $\mathcal{G} = (\mathcal{V}, \mathcal{E})$ , **n = 600**
- **21 Node features**
  - 3 one-hot encoding for secondary structures
  - 18 physico-chemical properties of secondary structures
- Edge = neighbors along the AA sequence or one of three nearest neighbors in space
- **No edge and graph attributes**

**EC 2.X.X.X Enzyme  
(Transferase)**

**Data split: Stratified 80% Train, 10% Validation, 10% Test**

# Methods

## Model Screening

**Objective** : Get the most optimal algorithm for a base model layout

**Method** : Try out different algorithm for static graph (5 runs)

1. (spectral) GCN
2. (spatial) GraphSAGE
3. (spatial) GATv2
4. (spatial) GIN

### Base layout

### Max. training memory

- GraphSAGE : 38.5 MB
- **GATv2 : 144.6 MB**

## Design Space Optimization (GraphSAGE)

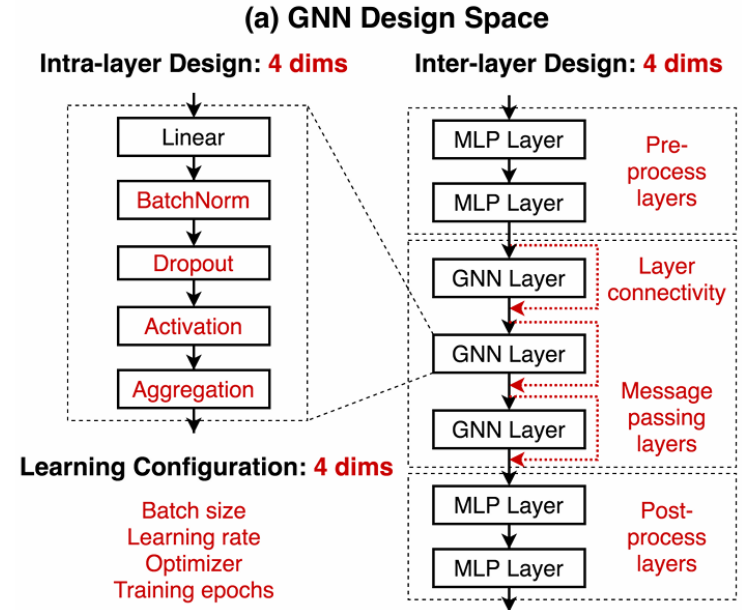

**Objective** : Get the most optimal model design by modifying design space.

**Method** : Sequential tuning, 5-run experiment

(1<sup>st</sup>) Dropout  $\in \{0.0, 0.2, 0.3, 0.5\}$

(2<sup>nd</sup>) Normalization  $\in \{\text{None}, \text{Batch}, \text{Layer}, \text{Graph}\}$

(3<sup>rd</sup>) Jumping Knowledge  $\in \{\text{None}, \text{cat}, \text{max}\}$

You, 2021 [DOI](#)

## Design Space Optimization (GraphSAGE)

(a) GNN Design Space

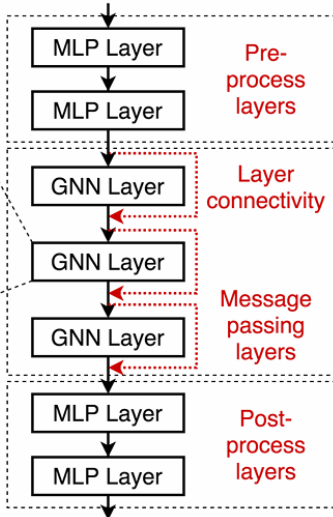

Intra-layer Design: 4 dims

Inter-layer Design: 4 dims

Learning Configuration: 4 dims

Batch size  
Learning rate  
Optimizer  
Training epochs

Dropout

Norm.

## Design Space Optimization (GraphSAGE)

### Jumping knowledge

## Performance-Memory Tradeoff (GraphSAGE)

**Objective** : Get the most optimal model design by modifying the number of parameters.  
(GNN hidden channels, layers)

# Conclusion

## Best Model

GraphSAGE + MLP head

Utilizes dropout, normalization, and jumping knowledge

## Test set performance

Class	f1-score
EC 1.X.X.X	0.706
EC 2.X.X.X	0.823
EC 3.X.X.X	0.800
EC 4.X.X.X	0.667
EC 5.X.X.X	0.818
EC 6.X.X.X	0.833
accuracy	0.783

## Success Criteria

1. Overall accuracy (test)  $\geq 0.75$
2. Class wise F1-score  $> 0.7$
3. Model max. memory allocation  $\leq 100$  MB

# Recommendations

1. Enrich the dataset to potentially develop deeper classification task
  - Geometric graph
  - More samples
  - More complex graph
2. Feature engineering
3. Benchmark more algorithm/architecture
4. More complex learning methods (self-supervised, ensemble, ...)
